

Veganism report on KINDFIRE

18-28/6/2026

“By being vegan across the whole Kindfire community - the team and participating artists for the full duration of the event, and guest speakers on the day of their participation - we collectively saved approximately 1623 kg CO₂ - the equivalent of driving a car for over 3 years, 19.3 kg CH₄ - more than 3 months (100 days) of gas consumption for hot water and heating of a 3-person house in an averagely insulated UK home, 152000 l H₂O - the amount of water used for about 2,200 showers.”

When assessing what new habits we can integrate into our lifestyle to reduce our environmental impact, switching to a plant-based diet is often an easy answer and a relatively quick fix compared to other more impactful swaps.

The GREENy bastARTs collective strongly advocates for plant-based diets and purchases, and so do its collaborators. On the occasion of the KindFire exhibition, all participants, including

artists and panellists, are asked to sign a pledge committing to being vegan for the duration of the exhibition. You may ask, how impactful can 10 days of being vegan really be? Our committee member Ascanio has put together a quantitative estimation of these figures.

From the findings of a recent paper published in Nature, he created a parametric model to assess the emission, water use, and land use reductions resulting from removing all meat products from one's diet. The calculations were based on the assumption that 44 people will eat plant-based food for the duration of the event, in addition to the vegan refreshments for the 150 participants during the Private Viewing and Finissage held at the beginning and end of the exhibition.

The most relevant findings of this assessment include:

- **1623 kg CO₂** - the equivalent of driving a car for over 3 years
- **19.3 kg CH₄** - more than 3 months (100 days) operations of a gas boiler (hot water and heating) in an averagely insulated 3-person dwelling
- **152000 l H₂O** - the amount of water used for about 2,200 showers

Figure 1 – Proportional Environmental Impact (relative to each typology of diet)

These results provide positive conclusions regarding how impactful removing animal products can be in only 10 days. Now, imagine what great change we could propel if these habits were undertaken for 365 days per year. And to take it a step further, what an incredible effect pairing such a simple swap can have with some other adjustments to your daily life! If you are searching for what these might be, GREENy bastARTs suggest:

- Replacing gas boilers with heat pumps in the home
- Switching to a renewable electricity supplier
- Commuting by light transport (bicycle or scooter), public transport, or electric vehicles (EVs)
- Travelling by train and avoiding air travel

If you would like to learn more about the scientific basis proving how being vegan reduces emissions, you can:

- Read [Nature's article](#) *Vegans, vegetarians, fish-eaters and meat-eaters in the UK show discrepant environmental impacts* (2023, University of Oxford)
- Consult the DEFRA carbon database available on the website gov.uk and the Poore and Nemecek's food carbon database (2018)
